

## Greenline Evacuated Tube Solar Pool Heating

Heat up your pool and jump in more often!

Greenline evacuated tube solar hot water systems capture the free energy of the sun to heat your swimming pool.

Evacuated tubes are a highly efficient way of heating water - even on overcast winter days.

Greenline's T60 pool heater generates 9kWh or 32 MJ midwinter (June/July in southern Victoria, 30% more June/July in northern Victoria).

The collector array contains 60 evacuated tubes and is 3.900 metres wide by 2.650 metres high.

It may be installed facing north on an un-shaded roof, wall or other suitable freestanding structure.

Make your pool more inviting throughout the year. Contact Greenline or your local distributor of Greenline Pool Products to discuss your pool heating requirements.
